Title: On semisimplicity of quantum cohomology of $\mathbb{P}^1$-orbifolds

Speaker: Hua-Zhong Ke (Sun Yat-sen University)

Abstract: A conjecture of Dubrovin states that a smooth projective variety has semisimple quantum cohomology if and only if its bounded derived category of coherent sheaves admits a full exceptional collection. It is natural to consider this conjecture for orbifolds. We will verify Dubrovin's conjecture for orbi-curves. The key observation is that the big quantum cohomology of a $\mathbb{P}^1$-orbifold $\mathcal{C}$ is generically semisimple. We also show that the small quantum cohomology of $\mathcal{C}$ is generically semisimple iff $\mathcal{C}$ is Fano, i.e. it has positive orbifold Euler characteristic.
