# Backward Stochastic Volterra Integral Equations

Jiongmin Yong

University of Central Florida

July, 2010

#### Outline

- 1. Introduction Motivations
- 2. Definition of Solution
- 3. Well-Posedness of BSVIEs
- 4. Properties of Solutions
- 5. Some Remarks

## 1. Introduction — Motivations

 $\begin{array}{ll} (\Omega, \mathcal{F}, \mathsf{F}, \mathsf{P}) \mid & \text{a complete } ^{-} \text{Itered probability space} \\ W(\cdot) \mid & \text{a one-dimensional standard Brownian motion} \\ \mathsf{F} \equiv \{\mathcal{F}_t\}_{t \geq 0} \mid & \text{natural } ^{-} \text{Itration of } W(\cdot), \text{ augmented by all} \\ & \mathsf{P-null sets} \end{array}$ 

Consider FSDE:  
(1.1)
$$\begin{cases}
< dX(t) = b(t, X(t))dt + \sigma(t, X(t))dW(t), \\
\vdots X(0) = x.
\end{cases}$$

Equivalent to:

(1.2) 
$$X(t) = x + \int_{0}^{Z} b(s, X(s)) ds + \int_{0}^{Z} \sigma(s, X(s)) dW(s).$$

General forward stochastic Volterra integral equation: (FSVIE)  $Z_{t} \qquad Z_{t}$ (1.3)  $X(t) = \varphi(t) + \int_{0}^{Z} b(t, s, X(s)) ds + \int_{0}^{Z} \sigma(t, s, X(s)) dW(s).$ 

- In general, FSVIE (1.3) cannot be transformed into a form of FSDE (1.1).
- FSVIE (1.3) allows some long-range dependence on the noises.
- Could allow  $\sigma(t, s, X(s))$  to be  $\mathcal{F}_t$ -measurable, still might have adapted solutions (Pardoux-Protter, 1990).
- May model wealth process involving investment delay, etc. (Duffie-Huang, 1986).

# Consider BSDE: $\overset{\otimes}{\overset{(1.4)}}{\overset{(1.4)}{\overset{(1.4)}{\overset{(1.4)}{\overset{(1.4)}{\overset{(1.4)}{\overset{(1.4)}{\overset{(1.4)}{\overset{(1.4)}{\overset{(1.4)}{\overset{(1.4)}{\overset{(1.4)}{\overset{(1.4)}{\overset{(1.4)}{\overset{(1.4)}}}{\overset{(1.4)}{\overset{($

- Linear case was introduced by Bismut (1973).
- Nonlinear case was introduced by Pardoux-Peng (1990).
- Can be applied to (European) contingent claim pricing, stochastic differential utility, dynamic risk measures,...
- Leads to nonlinear Feynman-Kac formula, pointwise convergence in homogenization problems, nonlinear expectation, ...

BSDE (1.4) is equivalent to

(1.5) 
$$Y(t) = \xi + \int_{t}^{Z} \int_{t}^{T} g(s, Y(s), Z(s)) ds - \int_{t}^{Z} \int_{t}^{T} Z(s) dW(s).$$

Called a backward stochastic Volterra integral equation (BSVIE). **Recall:** 

(1.2) 
$$X(t) = x + \int_{0}^{Z} b(s, X(s)) ds + \int_{0}^{Z} \sigma(s, X(s)) dW(s).$$
  
(1.3)  $X(t) = \varphi(t) + \int_{0}^{Z} b(t, s, X(s)) ds + \int_{0}^{Z} \sigma(t, s, X(s)) dW(s).$ 

#### Question:

What is the analog of (1.3) for (1.5) as (1.3) for (1.2)?

#### A Proposed Form:

(1.6) 
$$Y(t) = \psi(t) + \int_{t}^{Z} g(t, s, Y(s), Z(t, s), Z(s, t)) ds \\ - \int_{t}^{Z} Z(t, s) dW(s), \quad t \in [0, T],$$

 $(Y(\cdot), Z(\cdot, \cdot)) \mid \text{ unknown process}$ 

#### **Remarks:**

- The term Z(t, s) depends on t and s;
- The drift depends on both Z(t,s) and Z(s,t).
- (1.6) is strictly more general than BSDE (1.5).
- $\psi(\cdot)$  does not have to be F-adapted.

• Need 
$$Z(t, \cdot)$$
 to be F-adapted, and  
 $|Z(t,s)|^2 ds < \infty$ , a.e.  $t \in [0, T]$ , a.s.

By taking conditional expectation on (1.6), we have

$$Y(t) = \mathbb{E} \psi(t) + \int_{t}^{Z} g(t, s, Y(s), Z(t, s), Z(s, t)) ds \mathcal{F}_{t}^{\dagger}.$$

This leads to the **second** interesting motivation.

• Expected discounted utility (process) has the form:

$$Y(t) = \mathbb{E} \stackrel{\mathsf{h}}{\xi} e^{-\beta(T-t)} + \frac{\mathbb{Z}}{t} u(C(s)) e^{-\beta(s-t)} ds \stackrel{\mathsf{i}}{\mathcal{F}}_{t}^{\mathsf{i}}, \quad t \in [0, T].$$

- $C(\cdot)$  consumption process,  $u(\cdot)$  utility function  $\beta$  — discount rate,  $\xi$  — terminal time wealth
- Expected discounted utility is equivalent to a linear BSDE:

$$Y(t) = \xi + \sum_{t=1}^{Z} \sum_{t=1}^{T} \beta Y(s) + C(u(s))^{\alpha} ds - \sum_{t=1}^{Z} \sum_{t=1}^{T} Z(s) dW(s).$$

- $e^{-\beta(s-t)}$  exhibits a time-consistent memory effect. If the memory is not time-consistent, the utility process will not be a solution to a BSDE! But, it might be a solution to a BSVIE!
- Duffie-Epstein (1992) introduced stochastic differential utility:

$$Y(t) = \mathbb{E} \stackrel{\mathsf{h}}{\xi} + \frac{\mathbb{Z}}{t} g(s, Y(s)) ds \stackrel{\mathsf{L}}{\mathcal{F}}_{t}^{\mathsf{I}}, \quad t \in [0, T].$$

which is equivalent to a nonlinear BSDE:

$$Y(t) = \xi + \sum_{t}^{Z} g(s, Y(s)) ds - \sum_{t}^{Z} Z(s) dW(s).$$

## 2. Definition of Solutions.

Let 
$$H = \mathbb{R}^{m}$$
,  $\mathbb{R}^{m \times d}$ , etc., with norm  $|\cdot|_{\cdot}$  a  
 $L^{2}(\Omega) = \xi : \Omega \to H^{-} \xi \in \mathcal{F}_{T}, E|\xi|^{2} < \infty$ ,  
 $L^{2}((0,T) \times \Omega) = \varphi : (0,T) \times \Omega \to H^{-}$   
 $\varphi$  is  $\mathcal{B}([0,T]) \otimes \mathcal{F}_{T}$ -measurable,  $E^{-}_{0} |\varphi(t)|^{2} dt < \infty^{a}$ ,  
 $L^{2}_{\mathbb{F}}(0,T) = \varphi \in L^{2}((0,T) \times \Omega), \varphi(\cdot)$  is F-adapted.  
 $L^{2}(0,T; L^{2}_{\mathbb{F}}(0,T)) = Z; [0,T]^{2} \times \Omega \to H^{-}$   
 $Z(t, \cdot)$  is F-adapted, a.e.  $t \in [0,T]$ ,  
 $E^{-}_{0} |Z(t,s)|^{2} ds dt < \infty^{-}$ .

Recall:

(2.1) 
$$Y(t) = \psi(t) + \int_{t}^{Z} \int_{T}^{T} g(t, s, Y(s), Z(t, s), Z(s, t)) ds - \int_{t}^{t} Z(t, s) dW(s), \quad t \in [0, T],$$

Similar to BSDEs, it seems to be reasonable to introduce

**Definition 2.1.**  $(Y, Z) \in L^2_{\mathbb{F}}(0, T) \times L^2(0, T; L^2_{\mathbb{F}}(0, T))$  satisfying (2.1) is called an *adapted solution* of BSVIE (2.1).

Example 2.2. Consider BSVIE:

(2.2) 
$$Y(t) = \int_{t}^{Z} Z(s,t) ds - \int_{t}^{Z} Z(t,s) dW(s), \quad t \in [0,T].$$

We can check that

$$\begin{array}{l} & \otimes \\ & < \\ & < \end{array} \\ & Y(t) = (T-t)\zeta(t), \qquad t \in [0,T], \\ & \vdots \\ & Z(t,s) = I_{[0,t]}(s)\zeta(s), \qquad (t,s) \in [0,T] \times [0,T], \end{array}$$

is an adapted solution of (2.2) for any  $\zeta(\cdot) \in L^2_{\mathbb{F}}(0, T; \mathbb{R})$ . Thus, adapted solutions are not unique!

#### **Observation:**

(2.1) 
$$Y(t) = \psi(t) + \int_{t}^{Z} g(t, s, Y(s), Z(t, s), Z(s, t)) ds$$
$$- \int_{t}^{Z} Z(t, s) dW(s), \quad t \in [0, T],$$

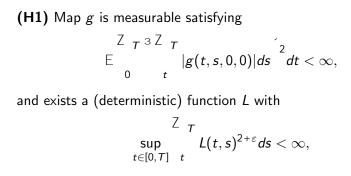

does not give enough \restrictions" on Z(t,s) with  $0 \le s \le t \le T$ .

Need to \specify" Z(t,s) for  $0 \le s \le t \le T$ .

**Definition 2.3.**  $(Y, Z) \in L^2_{\mathbb{F}}(0, T) \times L^2(0, T; L^2_{\mathbb{F}}(0, T))$  is called an *adapted M-solution* of (2.1) if (2.1) is satis<sup>-</sup>ed and also

(2.3) 
$$Y(t) = EY(t) + \int_{0}^{Z} Z(t,s) dW(s), \quad t \in [0, T].$$

## 3. Well-posedness of BSVIEs.

for some  $\varepsilon > 0$  such that

$$\begin{aligned} &|g(t,s,y,z,\zeta) - g(t,s,\bar{y},\bar{z},\bar{\zeta})| \\ &\leq L(t,s)^{i} |y-\bar{y}| + |z-\bar{z}| + |\zeta-\bar{\zeta}|^{\mathbb{C}}. \end{aligned}$$

**Theorem 3.1.** Let (H1) hold. Then  $\forall \psi$ , (2.1) admits a unique adapted M-solution (Y, Z). Moreover: for any  $r \in [0, T]$ ,

If  $(ar{Y},ar{Z})$  is the adapted M-solution corresponding to  $ar{\psi}$ , then

(3.2) 
$$Z = \begin{bmatrix} Z & Z & Z & Z \\ & E |Y(t) - \bar{Y}(t)|^2 dt + \begin{bmatrix} Z & Z & T \\ & E |Z(t,s) - \bar{Z}(t,s)|^2 ds dt \\ & r & r & r \\ & \leq C & E |\psi(t) - \bar{\psi}(t)|^2 dt, \quad \forall r \in [0, T]. \end{bmatrix}$$

#### A Difference between BSDEs and BSVIEs: For BSDE

$$Y(t) = \xi + \begin{bmatrix} Z & T \\ g(s, Y(s), Z(s))ds - \begin{bmatrix} Z & T \\ Z & Z \end{bmatrix} Z(s)dW(s)$$

$$Z & \begin{bmatrix} T & Z & Z \\ T & Z \end{bmatrix} Z(s)dW(s)$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s)$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s)$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s)$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s)$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\ T - \delta \end{bmatrix} Z(s)dW(s),$$

$$Z & \begin{bmatrix} T - \delta \\$$

Thus, one can obtain the solvability on  $[T - \delta, T]$ , then on  $[T - 2\delta, T - \delta]$ , etc., to get solvability on [0, T].

For BSVIE: (with  $t \in [0, T - \delta]$ )

$$Y(t) = \psi(t) + \int_{t}^{Z} g(t, s, Y(s), Z(t, s), Z(s, t)) ds - \int_{t}^{Z} Z(t, s) dW(s)$$

$$= \psi(t) + \int_{z}^{T-\delta} g(t, s, Y(s), Z(t, s), Z(s, t)) ds - \int_{z}^{T-\delta} Z(t, s) dW(s)$$

$$= \psi(t) + \int_{z}^{T-\delta} g(t, s, Y(s), Z(t, s), Z(s, t)) ds - \int_{z}^{T-\delta} Z(t, s) dW(s)$$

$$= \psi(t) + \int_{t}^{t} g(t, s, Y(s), Z(t, s), Z(s, t)) ds - \int_{t}^{z} Z(t, s) dW(s),$$

where it is not obvious if  $\psi(t)$  is/can be chosen  $\mathcal{F}_{\mathcal{T}-\delta}$ -measurable!

## 4. Properties of Solutions.

• A Duality Principle

ODE case: Consider

(4.1) 
$$\dot{x}(t) = Ax(t) + f(t), \quad x(0) = 0,$$

(4.2) 
$$\dot{y}(t) = -A^T y(t) - g(t), \quad y(T) = 0.$$

Then

$$\frac{d}{dt}^{\text{f}}\langle x(t), y(t) \rangle^{\alpha} = \langle f(t), y(t) \rangle - \langle x(t), g(t) \rangle.$$

Thus,

(4.3) 
$$Z_{\tau} \langle x(t), g(t) \rangle dt = \int_{0}^{Z_{\tau}} \langle y(t), f(t) \rangle dt.$$

- (4.2) is called an adjoint equation of (4.1).
- (4.3) is called a duality between (4.1) and (4.2).

• (linear) SDE and BSDE have a similar duality principle. Itô's formula is commonly used.

**Theorem 4.1.** Let 
$$\varphi_{\mathbb{Z}} \in L^{2}_{\mathbb{F}}(0, T)$$
 and  $\psi \in_{\mathbb{Z}} L^{2}_{t}((0, T) \times \Omega)$ . Let  
(4.4)  $X(t) = \varphi(t) + A_{0}(t, s)X(s)ds + A_{1}(t, s)X(s)dW(s),$   
 $Y(t) = \psi(t) + A_{0}(s, t)^{T}Y(s) + A_{1}(s, t)^{T}Z(s, t)^{\alpha}ds$   
(4.5)  $Z_{T} = C_{T} = C_{T}(t, s)dW(s), \quad t \in [0, T].$ 

Then the following relation holds:  
(4.6) 
$$E \bigvee_{0}^{Z_{T}} \langle Y(t), \varphi(t) \rangle dt = E \bigvee_{0}^{Z_{T}} \langle \psi(t), X(t) \rangle dt.$$

(4.5) | the adjoint equation of (4.4)
(4.6) | the duality between (4.4) and (4.5).

• A Comparison Theorem

Consider BSDEs: 
$$(k = 1, 2)$$
  
(4.7)
$$\begin{cases} < dY^{k}(t) = -g^{k}(t, Y^{k}(t), Z^{k}(t))dt + Z^{k}(t)dW(t), \\ \vdots \\ Y^{k}(T) = \xi^{k}. \end{cases}$$

Let  
(4.8)
$$\begin{cases} g^{1}(t,s,y,z) \leq g^{2}(t,s,y,z), \quad \forall (t,s,y,z), \\ \vdots \quad \xi^{1} \leq \xi^{2}, \quad \text{a.s.} \end{cases}$$

Then

(4.9) 
$$Y^1(t) \le Y^2(t), \quad t \in [0, T], \text{ a.s.}$$

- Itô formula is used in the proof.
- Does not rely on the comparison of FSDEs.

**Theorem 4.2.** For k = 1, 2, let  $g^k : [0, T]^2 \times \mathbb{R} \times \mathbb{R} \to \mathbb{R}$  and  $\psi^k(\cdot) \in L^2_{\mathbb{F}}(0 \mathcal{F}; \mathbb{R})$  such that (4.10)  $\begin{cases} g^1(t, s, y, \zeta) \leq g^2(t, s, y, \zeta), & \forall (t, s, y, \zeta), \\ \vdots & \psi^1(t) \leq \psi^2(t), & t \in [0, T], \text{ a.s.} \end{cases}$ 

Let 
$$(Y^{k}(\cdot), Z^{k}(\cdot, \cdot))$$
 be the adapted M-solution of BSIVE  

$$Y^{k}(t) = \psi^{k}(t) + g^{k}(t, s, Y^{k}(s), Z^{k}(s, t))ds$$
(4.11)
$$Z^{t}_{T} - Z^{k}(t, s)dW(s).$$

Then the following holds:

(4.12) 
$$Y^1(t) \le Y^2(t), \quad \forall t \in [0, T].$$

#### • Sub-Additivity and Convexity.

Let  $(Y(\cdot), Z(\cdot, \cdot))$  be the adapted solution of BSVIE

(4.13) 
$$Y(t) = \psi(t) + \int_{t}^{Z} g(t, s, Y(s), Z(s, t)) ds$$
$$- \int_{t}^{t} Z(t, s) dW(s).$$

Denote

- (4.14)  $\rho(t; \psi(\cdot)) = Y(t), \quad t \in [0, T].$
- $\psi(\cdot) \mapsto \rho(t; -\psi(\cdot))$  is essentially a *dynamic risk measure*.

**Proposition 4.4.** Let  $g : [0, T]^2 \times \mathbb{R} \times \mathbb{R}^d \to \mathbb{R}$ . (i) Suppose  $(y, \zeta) \mapsto g(t, s, y, \zeta)$  is sub-additive:

$$g(t, s, y_1 + y_2, \zeta_1 + \zeta_2) \le g(t, s, y_1, \zeta_1) + g(t, s, y_2, \zeta_2),$$
  
$$\forall (t, s) \in [0, T]^2, \ y_1, y_2 \in \mathbb{R}, \ \zeta_1, \zeta_2 \in \mathbb{R}^d, \ \text{a.s.} \ ,$$

Then  $\psi(\cdot) \mapsto \rho(t; \psi(\cdot))$  is sub-additive:

 $\rho(t;\psi_1(\cdot)+\psi_2(\cdot)) \le \rho(t;\psi_1(\cdot)) + \rho(t;\psi_2(\cdot)), \quad t \in [0,T], \text{ a.s.}$ 

(ii) Suppose  $(y, z) \mapsto g(t, s, y, \zeta)$  is convex:

$$g(t, s, \lambda y_1 + (1 - \lambda)y_2, \lambda \zeta_1 + (1 - \lambda)\zeta_2) \\ \leq \lambda g(t, s, y_1, \zeta_1) + (1 - \lambda)g(t, s, y_2, \zeta_2), \\ \forall (t, s) \in [0, T]^2, \ y_1, y_2 \in \mathbb{R}, \ \zeta_1, \zeta_2 \in \mathbb{R}^d, \ \text{a.s.}, \quad \lambda \in [0, 1].$$

Then  $\psi(\cdot) \mapsto \rho(t; \psi(\cdot))$  is convex:

$$\begin{split} \rho(t;\lambda\psi_1(\cdot)+(1-\lambda)\psi_2(\cdot))&\leq\lambda\rho(t;\psi_1(\cdot))+(1-\lambda)\rho(t;\psi_2(\cdot)),\\ t\in[0,T], \text{ a.s. },\ \lambda\in[0,1]. \end{split}$$

• Similar results hold if exchanging super-additivity and sub-additivity, convexity and concavity, respectively.

## 5. Some Remarks:

• Regularity of adapted M-solutions:

(1.6) 
$$Y(t) = \psi(t) + \int_{t}^{Z} g(t, s, Y(s), Z(t, s), Z(s, t)) ds - \int_{t}^{Z} Z(t, s) dW(s), \quad t \in [0, T].$$

Continuity of  $t \mapsto Y(t)$  is not trivial. Malliavin calculus will be involved.

- Necessary conditions for optimal control of FSVIEs can be obtained.
- Existence of dynamic risk measure for general position processes.

. . . . . .

Thank You!
