# DISTRIBUTION AND CORRELATION-FREE TWO-SAMPLE TEST OF HIGH-DIMENSIONAL MEANS 

By Kaijie Xue ${ }^{1}$ and Fang $\mathrm{YaO}^{2}$<br>${ }^{1}$ School of Statistics and Data Science, Nankai University, kaijie@ nankai.edu.cn<br>${ }^{2}$ Department of Probability and Statistics, School of Mathematical Sciences, Center for Statistical Science, Peking University, fyao@math.pku.edu.cn

We propose a two-sample test for high-dime sio al mea s that requires either distributio al or correlatio al assumptio s, besides some weak co ditio so the mome ts a d tail properties of the eleme ts i the ra dom vectors. This two-sample test based o a o trivial exte sio of the o e-sample ce tral limit theorem (Ann. Probab. 45 (2017) 2309 2352) provides a practicall useful procedure with rigorous theoretical guara tees o its si e a d power assessme t. I particular, the proposed test is eas to compute a d does ot require the i depe de tl a d ide ticall distributed assumptio, which is allowed to have differe $t$ distributio s a d arbitrar correlatio structures. Further desired features i clude weaker mome ts a d tail co ditio stha existi $g$ methods, allowa ce for highl $u$ equal sample si es, co siste $t$ power behavior $u$ der fairl ge eral alter ative, data dime sio allowed to be expoe tiall high $u$ der the umbrella of such ge eral co ditio s. Simulated a d real data examples have demo strated favorable umerical performa ce over existi g methods.

1. Introduction. Two-sample test of high dime sio al mea s as o e of the ke issues has attracted a great deal of atte tio due to its importa ce i various applicatio s , i cludi g [2 5, $1012,19,2426,29]$ a d [21], amo $g$ others. I this article, we tackle this problem with the theoretical adva ce brought $b$ a high-dime sio al two-sample ce tral limit theorem. Based o this, we propose a ew t pe of testi g procedure, called distributio a d correlatio -free (DCF) two-sample mea test, which requires either distributio al or correlatio al assumptio sa d greatl e ha ces its ge eralit i practice.

We de ote two samples b $X^{n}=\left\{X_{1}, \ldots, X_{n}\right\}$ a d $Y^{m}=\left\{Y_{1}, \ldots, Y_{m}\right\}$ respectivel, where $X^{n}$ is a collectio of mutuall i depe de t (not necessarily identically distributed) ra dom vectors i $\mathbb{R}^{p}$ with $X_{i}=\left(X_{i 1}, \ldots, X_{i p}\right)^{\prime}$ a d $E\left(X_{i}\right)=\mu^{X}=\left(\mu_{1}^{X}, \ldots, \mu_{p}^{X}\right)^{\prime}, i=1, \ldots, n$, a d $Y^{m}$ is de ed i a similar fashio with $E\left(Y_{i}\right)=\mu^{Y}=\left(\mu_{1}^{Y}, \ldots, \mu_{p}^{Y}\right)^{\prime}$ for all $i=1, \ldots, m$. The ormali ed sums $S_{n}^{X}$ a d $S_{m}^{Y}$ are de oted b $S_{n}^{X}=n^{-1 / 2} \sum_{i=1}^{n} X_{i}=\left(S_{n 1}^{X}, \ldots, S_{n p}^{X}\right)^{\prime}$ a d $S_{m}^{Y}=m^{-1 / 2} \sum_{i=1}^{m} Y_{i}=\left(S_{m 1}^{Y}, \ldots, S_{m p}^{Y}\right)^{\prime}$, respectivel . Note that we o 1 assume i depe de t observatio s, a d each sample with a commo mea. The h pothesis of i terest is

$$
H_{0}: \mu^{X}=\mu^{Y} \quad \text { v.s. } \quad H_{a}: \mu^{X} \neq \mu^{Y},
$$

a d the proposed two-sample DCF mea test is such that we reject $H_{0}: \mu^{X}=\mu^{Y}$ at sig i ca ce level $\alpha \in(0,1)$, provided that

$$
T_{n}=\left\|S_{n}^{X}-n^{1 / 2} m^{-1 / 2} S_{m}^{Y}\right\|_{\infty} \geq c_{B}(\alpha)
$$

where $T_{n}=\left\|S_{n}^{X}-n^{1 / 2} m^{-1 / 2} S_{m}^{Y}\right\|_{\infty}$ is the test statistic that o 1 depe ds o the i it orm of the sample mea differe ce, a $\mathrm{d} c_{B}(\alpha)$ that pla s a ce tral role i this test is a datadrive critical value de ed i (5) of Theorem 3. It is worth me tio i g that $c_{B}(\alpha)$ is eas to

[^0]compute via a multiplier bootstrap based o a set of i depe de tl a dide ticall distributed (i.i.d.) sta dard ormal ra dom variables that are i depe de $t$ of the data, where the explicit calculatio is described after (6). Note that the computatio of the proposed test is of a order $O\{n(p+N)\}$, more ef cie tha $O(N n p)$ that is usuall dema ded b a ge eral resampli g method. I spite of the simple structure of $T_{n}$, we shall illustrate its desirable theoretical properties a d superior umerical performa ce $i$ the rest of the article.

We emphasi e that our main contributions reside o developi $g$ a practicall useful test that is computatio all ef cie $t$ with rigorous theoretical guara tees give $i$ Theorem 3 5. We begi with derivi $g$ o trivial two-sample exte sio $s$ of the o e-sample ce tral limit theorems a d its correspo di g bootstrap approximatio theorems i high dime sio s [9], where we do ot require the ratio betwee sample si es $n /(n+m)$ to co verge but merel reside withi a ope i terval $\left(c_{1}, c_{2}\right), 0<c_{1} \leq c_{2}<1$, as $n, m \rightarrow \infty$. Further, Theorem 3 la $s$ dow a fou datio for co ducti $g$ the two-sample DCF mea test $u$ iforml over all $\alpha \in(0,1)$. The power of the proposed test is assessed i Theorem 4 that establishes the as mptotic equivale ce betwee the estimated a d true versio s. Moreover, the as mptotic power is show co siste ti Theorem 5 u der some ge eral alter atives with o sparsit or correlatio co strai ts.

The proposed test sets itself apart from existi g methods b allowi g for o -i.i.d. ra dom vectors i both samples. The distributio -free feature is i the se se that, $u$ der the umbrella of some mild assumptio s o the mome ts a d tail properties of the coordi ates, there is o other restrictio $o$ the distributio $s$ of those ra dom vectors. I co trast, existi g literature require the ra dom vectors withi sample to be i.i.d. [3 6], a d some methods further restrict the coordi ates to follow a certai $t$ pe of distributio, such as Gaussia or sub-Gaussia $[26,29]$. This feature sets the proposed test free of maki $g$ assumptio $s$ such as i.i.d. or sub-Gaussia it , which is desirable as distributio s of real data are ofte co fou ded b umerous factors uk ow to researchers. A other ke feature is correlatio -free i the se se that i dividual ra dom vectors ma have differe ta d arbitrar correlatio structures. B co trast, most previous works assume ot o 1 a commo withi -sample correlatio matrix, but also some structural co ditio s, such as those o trace [5], mixi g co ditio s [21] or bou ded eige values from below [3]. It is worth oti $g$ that our assumptio so the mome ts a d tail properties of the coordi ates i ra dom vectors are also weaker tha those adopted i literature, for example, $[3,11]$ a $d[21]$ assumed a commo xed upper bou $d$ to those mome ts, [5] a d [19] allowed a portio of those mome ts to grow but paid a price o correlatio assumptio s.

We also stress that the proposed test possesses co siste t power behavior u der fairl ge eral alter ative (a mild separatio lower bou do $\mu^{X}-\mu^{Y}$ i Theorem 5) with either sparsit or correlatio co ditio s, while previous work requiri g either sparsit [26] or structural assumptio o sig al stre gth [5,11] or correlatio [21], or both [3]. Lastl , we poi tout that the data dime sio $p$ ca be expo e tiall high relative to the sample si e $u$ der the umbrella of such mild assumptio s . This is also favorable compared to previous work, as [3,5] a d [21] allowed such ultrahigh dime sio su der o trivial co ditio so either the distributio t pe (e.g., sub-Gaussia ) or the correlatio structure (or both) as a tradeoff.

We co clude the I troductio $b$ oti $g$ releva $t$ work o o e-sample high-dime sio al mea test, such as [14 18, 20, 23, 27, 28] a d [1], amo $g$ others. It is relativel easier to develop a o e-sample DCF mea test with similar adva tages based o results i [9], thus is ot pursued here. The rest of the article is orga $i$ ed as follows. I Sectio 2, we prese $t$ the two-sample high-dime sio al ce tral limit theorem, a d the result o multiplier bootstrap for evaluati $g$ the Gaussia approximatio .I Sectio 3, we establish the mai result Theorem 3 for co ducti $g$ the proposed test, a d Theorem 4 to approximate its power fu ctio, followed b Theorem 5 to a al e its as mptotic power $u$ der alter atives. Simulatio stud is carried
out i Sectio 4 to compare with existi $g$ methods, a da applicatio to a real data example is prese ted i Sectio 5 . We collect the auxiliar lemmas a d the proofs of the mai results, Theorems 35 i the Appe dix, a d delegate the proofs of Theorems 12 , Corollar 1 a d the auxiliar lemmas to a o li e Suppleme tar Material [22] for space eco om .
2. Two-sample central limit theorem and multiplier bootstrap in high dimensions. I this sectio, we rst prese $t$ a i telligible two-sample ce tral limit theorem i high dime sio s, which is derived from its more abstract versio i Lemma 4 i the Appe dix. The the result o the as mptotic equivale ce betwee the Gaussia approximatio appearedi the two-sample ce tral limit theorem a d its multiplier bootstrap term is also elaborated, whose abstract versio ca be referred to Lemma 5.

We rst list some otatio used throughout the paper. For two vectors $x=\left(x_{1}, \ldots, x_{p}\right) \in$ $\mathbb{R}^{p}$ a d $y=\left(y_{1}, \ldots, y_{p}\right)^{\prime} \in \mathbb{R}^{p}$, write $x \leq y$ if $x_{j} \leq y_{j}$ for all $j=1, \ldots, p$. For a $\quad x=$ $\left(x_{1}, \ldots, x_{p}\right)^{\prime} \in \mathbb{R}^{p}$ a $\mathrm{d} a \in \mathbb{R}$, de ote $x+a=\left(x_{1}+a, \ldots, x_{p}+a\right)^{\prime}$. For a $a, b \in \mathbb{R}$, use the otatio $a \vee b=\max \{a, b\}$ a d $a \wedge b=\operatorname{mi}\{a, b\}$. For a two seque ces of co sta ts $a_{n}$ a d $b_{n}$, write $a_{n} \lesssim b_{n}$ if $a_{n} \leq C b_{n}$ up to a u iversal co sta $\mathrm{t} C>0$, a d $a_{n} \sim b_{n}$ if $a_{n} \lesssim b_{n}$ a d $b_{n} \lesssim a_{n}$. For a matrix $A=\left(a_{i j}\right)$, de $\quad \mathrm{e}\|A\|_{\infty}=\max _{i, j}\left|a_{i j}\right|$. For a fu ctio $f: \mathbb{R} \rightarrow \mathbb{R}$, write $\|f\|_{\infty}=\sup _{z \in \mathbb{R}}|f(z)|$. For a smooth fu ctio $g: \mathbb{R}^{p} \rightarrow \mathbb{R}$, we adopt i dices to represe t the partial derivatives for brevit, for example, $\partial_{j} \partial_{k} \partial_{l} g=g_{j k l}$. For a $\alpha>0$, de e the fu ctio $\psi_{\alpha}(x)=\exp \left(x^{\alpha}\right)-1$ for $x \in[0, \infty)$, the for a ra dom variable $X$, de e

$$
\begin{equation*}
\|X\|_{\psi_{\alpha}}=\mathrm{if}\left\{\lambda>0: E\left\{\psi_{\alpha}(|X| / \lambda)\right\} \leq 1\right\} \tag{1}
\end{equation*}
$$

which is a Orlic orm for $\alpha \in[1, \infty)$ a d a quasi- orm for $\alpha \in(0,1)$.
De ote $F^{n}=\left\{F_{1}, \ldots, F_{n}\right\}$ as a set of mutuall i depe de t ra dom vectors i $\mathbb{R}^{p}$ such that $F_{i}=\left(F_{i 1}, \ldots, F_{i p}\right)^{\prime}$ a d $F_{i} \sim N_{p}\left(\mu^{X}, E\left\{\left(X_{i}-\mu^{X}\right)\left(X_{i}-\mu^{X}\right)^{\prime}\right\}\right)$ for all $i=1, \ldots, n$, which de otes a Gaussia approximatio to $X^{n}$. Likewise, de e a set of mutuall i depe de t ra dom vectors $G^{m}=\left\{G_{1}, \ldots, G_{m}\right\}$ i $\mathbb{R}^{p}$ such that $G_{i}=\left(G_{i 1}, \ldots, G_{i p}\right)^{\prime}$ a d $G_{i} \sim N_{p}\left(\mu^{Y}, E\left\{\left(Y_{i}-\mu^{Y}\right)\left(Y_{i}-\mu^{Y}\right)^{\prime}\right\}\right)$ for all $i=1, \ldots, m$ to approximate $Y^{m}$. The sets $X^{n}, Y^{m}, F^{n}$ a d $G^{m}$ are assumed to be i depe de t of each other. To this e d, deote the ormali ed sums $S_{n}^{X}, S_{n}^{F}, S_{m}^{Y}$ a d $S_{m}^{G}$ b $S_{n}^{X}=n^{-1 / 2} \sum_{i=1}^{n} X_{i}=\left(S_{n 1}^{X}, \ldots, S_{n p}^{X}\right)^{\prime}$, $S_{n}^{F}=n^{-1 / 2} \sum_{i=1}^{n} F_{i}=\left(S_{n 1}^{F}, \ldots, S_{n p}^{F}\right)^{\prime}, S_{m}^{Y}=m^{-1 / 2} \sum_{i=1}^{m} Y_{i}=\left(S_{m 1}^{Y}, \ldots, S_{m p}^{Y}\right)^{\prime}$ ad $S_{m}^{G}=$ $m^{-1 / 2} \sum_{i=1}^{m} G_{i}=\left(S_{m 1}^{G}, \ldots, S_{m p}^{G}\right)^{\prime}$, where $S_{n}^{F}$ a d $S_{m}^{G}$ serve as the Gaussia approximatio s for $S_{n}^{X}$ a d $S_{m}^{Y}$, respectivel . Lastl, de ote a set of i depe de t sta dard ormal ra dom variables $e^{n+m}=\left\{e_{1}, \ldots, e_{n+m}\right\}$ that is i depe de t of a of $X^{n}, F^{n}, Y^{m}$ a d $G^{m}$.
2.1. Two-sample central limit theorem in high dimensions. To i troduce Theorem 1, a list of useful otatio are give as follows. De ote

$$
L_{n}^{X}=\max _{1 \leq j \leq p} \sum_{i=1}^{n} E\left(\left|X_{i j}-\mu_{j}^{X}\right|^{3}\right) / n, \quad L_{m}^{Y}=\max _{1 \leq j \leq p} \sum_{i=1}^{m} E\left(\left|Y_{i j}-\mu_{j}^{Y}\right|^{3}\right) / m
$$

We de ote the ke qua tit $\rho_{n, m}^{* *} \mathrm{~b}$

$$
\begin{align*}
\rho_{n, m}^{* *}= & \sup _{A \in \mathcal{A}^{\mathrm{Re}}} \mid P\left(S_{n}^{X}-n^{1 / 2} \mu^{X}+\delta_{n, m} S_{m}^{Y}-\delta_{n, m} m^{1 / 2} \mu^{Y} \in A\right)  \tag{2}\\
& -P\left(S_{n}^{F}-n^{1 / 2} \mu^{X}+\delta_{n, m} S_{m}^{G}-\delta_{n, m} m^{1 / 2} \mu^{Y} \in A\right) \mid,
\end{align*}
$$

where $P\left(S_{n}^{X}-n^{1 / 2} \mu^{X}+\delta_{n, m} S_{m}^{Y}-\delta_{n, m} m^{1 / 2} \mu^{Y} \in A\right)$ represe ts the u k ow probabilit of i terest, a d $P\left(S_{n}^{F}-n^{1 / 2} \mu^{X}+\delta_{n, m} S_{m}^{G}-\delta_{n, m} m^{1 / 2} \mu^{Y} \in A\right)$ serves as a Gaussia approximatio to this probabilit of i terest, a $\mathrm{d} \rho_{n, m}^{* *}$ measures the error of approximatio over all
h perrecta gles $A \in \mathcal{A}^{\mathrm{Re}}$. Note that $\mathcal{A}^{\mathrm{Re}}$ is the class of all h perrecta gles i $\mathbb{R}^{p}$ of the form $\left\{w \in \mathbb{R}^{p}: a_{j} \leq w_{j} \leq b_{j}\right.$ for all $\left.j=1, \ldots, p\right\}$ with $-\infty \leq a_{j} \leq b_{j} \leq \infty$ for all $j=1, \ldots, p$. B assumi g more speci c co ditio s , Theorem 1 gives a more explicit bou do $\rho_{n, m}^{* *}$ compared to Lemma 4.

THEOREM 1. For any sequence of constants $\delta_{n, m}$, assume we have the following conditions (a)-(e):
(a) There exist universal constants $\delta_{1}>\delta_{2}>0$ such that $\delta_{2}<\left|\delta_{n, m}\right|<\delta_{1}$.
(b) There exists a universal constant $b>0$ such that

$$
\operatorname{mi}_{1 \leq j \leq p} E\left\{\left(S_{n j}^{X}-n^{1 / 2} \mu_{j}^{X}+\delta_{n, m} S_{m j}^{Y}-\delta_{n, m} m^{1 / 2} \mu_{j}^{Y}\right)^{2}\right\} \geq b .
$$

(c) There exists a sequence of constants $B_{n, m} \geq 1$ such that $L_{n}^{X} \leq B_{n, m}$ and $L_{m}^{Y} \leq B_{n, m}$.
(d) The sequence of constants $B_{n, m}$ defined in (c) also satisfies

$$
\begin{aligned}
& \max _{1 \leq i \leq n} \max _{1 \leq j \leq p} E\left\{\exp \left(\left|X_{i j}-\mu_{j}^{X}\right| / B_{n, m}\right)\right\} \leq 2, \\
& \max _{1 \leq i \leq m} \max _{1 \leq j \leq p} E\left\{\exp \left(\left|Y_{i j}-\mu_{j}^{Y}\right| / B_{n, m}\right)\right\} \leq 2 .
\end{aligned}
$$

(e) There exists a universal constant $c_{1}>0$ such that

$$
\left(B_{n, m}\right)^{2}\{\log (p n)\}^{7} / n \leq c_{1}, \quad\left(B_{n, m}\right)^{2}\{\log (p m)\}^{7} / m \leq c_{1}
$$

Then we have the following property, where $\rho_{m, n}^{* *}$ is defined in (2):

$$
\rho_{n, m}^{* *} \leq K_{3}\left(\left[\left(B_{n, m}\right)^{2}\{\log (p n)\}^{7} / n\right]^{1 / 6}+\left[\left(B_{n, m}\right)^{2}\{\log (p m)\}^{7} / m\right]^{1 / 6}\right),
$$

for a universal constant $K_{3}>0$.
Co ditio $s$ (a) (c) correspo $d$ to the mome $t$ properties of the coordi ates, a $d$ (d) co cer s the tail properties. It follows from (a) a d (b) that the mome ts on average are bou ded below awa from ero, he ce allowi $g$ certai proportio of these mome ts to co verge to ero. This is weaker tha previous work that usuall require a $u$ iform lower bou do all mome ts [3, 11, 21]. Co ditio (c) implies that the mome ts on average has a upper bou d $B_{n, m}$ that ca diverge to i it without restrictio o correlatio , thus offers more exibilit tha those i literature that dema ds either a xed upper bou d or a certai correlatio structure or both. To appreciate this, letti $\mathrm{g} B_{n, m} \sim n^{1 / 3}$, o e otes that all the varia ces of the coordi ates are allowed to be u iforml as large as $B_{n, m}^{2 / 3} \sim n^{2 / 9} \rightarrow \infty \mathrm{u}$ der co ditio (c), while o restrictio o correlatio is eeded. As a compariso, if we assig a commo covaria ce to two samples, sa $\Sigma=\left(\Sigma_{j k}\right)_{1 \leq j, k \leq p}$ with each $\Sigma_{j k}=n^{2 / 9} \rho^{1\{j \neq k\}}$ for some co sta $\mathrm{t} \rho \in(0,1)$, the the trace co ditio i [5] implies that $p=o(1)$. Compared with a
xed upper bou do the tails of the coordi ates [3,21], co ditio (d) allows for $u$ iforml divergi g tails as lo g as $B_{n, m} \rightarrow \infty$. Co ditio (e) i dicates that the data dime sio $p \mathrm{ca}$ grow expo e tiall i $n$, provided that $B_{n, m}$ is of some appropriate order. These co ditio s as a whole set the basis for the so-called distributio a d correlatio -free_features.
2.2. Two-sample multiplier bootstrap in high dimensions. Due to the $\mathrm{u} k$ ow probabilit i $\rho_{n, m}^{* *}(2)$ de oti g the Gaussia approximatio, it limits the applicabilit of the ce tral limit theorem for i fere ce. The idea is to adopt a multiplier bootstrap to approximate its Gaussia approximatio, a dqua tif its approximatio error bou d. De ote

$$
\Sigma^{X}=n^{-1} \sum_{i=1}^{n} E\{(
$$

where $\bar{X}=n^{-1} \sum_{i=1}^{n} X_{i}=\left(\bar{X}_{1}, \ldots, \bar{X}_{p}\right)^{\prime}$. A alogousl, de ote $\Sigma^{Y}, \hat{\Sigma}^{Y}$ a d $\bar{Y}$. Now we i troduce the multiplier bootstrap approximatio i this co text. Let $e^{n+m}=\left\{e_{1}, \ldots, e_{n+m}\right\}$ be a set of i.i.d. sta dard ormal ra dom variables $i$ depe de $t$ of the data, we further de ote

$$
\begin{equation*}
S_{n}^{e X}=n^{-1 / 2} \sum_{i=1}^{n} e_{i}\left(X_{i}-\bar{X}\right), \quad S_{m}^{e Y}=m^{-1 / 2} \sum_{i=1}^{m} e_{i+n}\left(Y_{i}-\bar{Y}\right), \tag{3}
\end{equation*}
$$

a d it is obvious that $E_{e}\left(S_{n}^{e X} S_{n}^{e X^{\prime}}\right)=\hat{\Sigma}^{X}$ a d $E_{e}\left(S_{n}^{e Y} S_{n}^{e Y^{\prime}}\right)=\hat{\Sigma}^{Y}$, where $E_{e}(\cdot)$ mea s the expectatio with respect to $e^{n+m} \mathrm{o} 1$. The, for a seque ce of co sta ts $\delta_{n, m}$ that depe ds o both $n$ a d $m$, we de ote the qua tit of i terest $\rho_{n, m}^{M B} \mathrm{~b}$

$$
\begin{align*}
\rho_{n, m}^{M B}= & \sup _{A \in \mathcal{A}^{\mathrm{Re}}} \mid P_{e}\left(S_{n}^{e X}+\delta_{n, m} S_{m}^{e Y} \in A\right)  \tag{4}\\
& -P\left(S_{n}^{F}-n^{1 / 2} \mu^{X}+\delta_{n, m} S_{m}^{G}-\delta_{n, m} m^{1 / 2} \mu^{Y} \in A\right) \mid,
\end{align*}
$$

where $P_{e}(\cdot)$ mea s the probabilit with respect to $e^{n+m}$ o 1, a d $P_{e}\left(S_{n}^{e X}+\delta_{n, m} S_{m}^{e Y} \in A\right)$ acts as the multiplier bootstrap approximatio for the Gaussia approximatio $P\left(S_{n}^{F}-n^{1 / 2} \mu^{X}+\right.$ $\delta_{n, m} S_{m}^{G}-\delta_{n, m} m^{1 / 2} \mu^{Y} \in A$ ). I particular, $\rho_{n, m}^{M B}$ ca be u derstood as a measure of error betwee the two approximatio s over all h perrecta gles $A \in \mathcal{A}^{\mathrm{Re}}$. The followi g theorem provides a more explicit bou do $\rho_{n, m}^{M B}$ i co trast to its abstract versio stated i Lemma 5 i the Appe dix.

THEOREM 2. For any sequence of constants $\delta_{n, m}$, assume we have the following conditions (a)-(e),
(a) There exists a universal constant $\delta_{1}>0$ such that $\left|\delta_{n, m}\right|<\delta_{1}$.
(b) There exists a universal constant $b>0$ such that

$$
\operatorname{mi}_{1 \leq j \leq p} E\left\{\left(S_{n j}^{X}-n^{1 / 2} \mu_{j}^{X}+\delta_{n, m} S_{m j}^{Y}-\delta_{n, m} m^{1 / 2} \mu_{j}^{Y}\right)^{2}\right\} \geq b
$$

(c) There exists a sequence of constants $B_{n, m} \geq 1$ such that

$$
\begin{aligned}
& \max _{1 \leq j \leq p} \sum_{i=1}^{n} E\left\{\left(X_{i j}-\mu_{j}^{X}\right)^{4}\right\} / n \leq B_{n, m}^{2}, \\
& \max _{1 \leq j \leq p} \sum_{i=1}^{m} E\left\{\left(Y_{i j}-\mu_{j}^{Y}\right)^{4}\right\} / m \leq B_{n, m}^{2} .
\end{aligned}
$$

(d) The sequence of constants $B_{n, m}$ defined in (c) also satisfies

$$
\begin{aligned}
& \max _{1 \leq i \leq n} \max _{1 \leq j \leq p} E\left\{\exp \left(\left|X_{i j}-\mu_{j}^{X}\right| / B_{n, m}\right)\right\} \leq 2, \\
& \max _{1 \leq i \leq m} \max _{1 \leq j \leq p} E\left\{\exp \left(\left|Y_{i j}-\mu_{j}^{Y}\right| / B_{n, m}\right)\right\} \leq 2
\end{aligned}
$$

(e) There exists a sequence of constants $\alpha_{n, m} \in\left(0, e^{-1}\right)$ such that

$$
\begin{aligned}
B_{n, m}^{2} \log ^{5}(p n) \log ^{2}\left(1 / \alpha_{n, m}\right) / n & \leq 1, \\
B_{n, m}^{2} \log ^{5}(p m) \log ^{2}\left(1 / \alpha_{n, m}\right) / m & \leq 1 .
\end{aligned}
$$

Then there exists a universal constant $c^{*}>0$ such that with probability at least $1-\gamma_{n, m}$ where

$$
\begin{aligned}
\gamma_{n, m}= & \left(\alpha_{n, m}\right)^{\log (p n) / 3}+3\left(\alpha_{n, m}\right)^{\log ^{1 / 2}(p n) / c_{*}}+\left(\alpha_{n, m}\right)^{\log (p m) / 3} \\
& +3\left(\alpha_{n, m}\right)^{\log ^{1 / 2}(p m) / c_{*}}+\left(\alpha_{n, m}\right)^{\log ^{3}(p n) / 6}+3\left(\alpha_{n, m}\right)^{\log ^{3}(p n) / c_{*}} \\
& +\left(\alpha_{n, m}\right)^{\log ^{3}(p m) / 6}+3\left(\alpha_{n, m}\right)^{\log ^{3}(p m) / c_{*}}
\end{aligned}
$$

we have the following property, where $\rho_{n, m}^{M B}$ is defined in (4),

$$
\begin{aligned}
\rho_{n, m}^{M B} \lesssim & \left\{B_{n, m}^{2} \log ^{5}(p n) \log ^{2}\left(1 / \alpha_{n, m}\right) / n\right\}^{1 / 6} \\
& +\left\{B_{n, m}^{2} \log ^{5}(p m) \log ^{2}\left(1 / \alpha_{n, m}\right) / m\right\}^{1 / 6}
\end{aligned}
$$

Co ditio s (a) (c) pertai to the mome $t$ properties of the coordi ates, co ditio (d) co cer s the tail properties a d co ditio (e) characteri es the order of $p$. These co ditio s have the desirable features as those i Theorem 1 , such as allowi g for u iforml divergi g mome ts a d tails a d so o. Moreover, b combi i g Theorem 2 with a two-sample Borel Ca telli lemma (i.e., Lemma 6), where co ditio (f) is eeded for Lemma 6, o e ca deduce Corollar 1 below, which facilitates the derivatio of our mai result i Theorem 3.

Corollary 1. For any sequence of constants $\delta_{n, m}$, assume the conditions (a)-(e) in Theorem 2 hold. Also suppose that the condition (f) holds as follows:
(f) The sequence of constants $\gamma_{n, m}$ defined in Theorem 2 also satisfies

$$
\sum_{n} \sum_{m} \gamma_{n, m}<\infty .
$$

Then with probability one, we have the following property, where $\rho_{n, m}^{M B}$ is defined in (4),

$$
\begin{aligned}
\rho_{n, m}^{M B} \lesssim & \left\{B_{n, m}^{2} \log ^{5}(p n) \log ^{2}\left(1 / \alpha_{n, m}\right) / n\right\}^{1 / 6} \\
& +\left\{B_{n, m}^{2} \log ^{5}(p m) \log ^{2}\left(1 / \alpha_{n, m}\right) / m\right\}^{1 / 6}
\end{aligned}
$$

3. Two-sample mean test in high dimensions. I this sectio , based o the theoretical results from the precedi g sectio, we rst establish the mai result, Theorem 3, which gives a co de ce regio for the mea differe ce $\left(\mu^{X}-\mu^{Y}\right)$ a d, equivale tl , the DCF test procedure. We ote that the theoretical guara tee is $u$ iform for all $\alpha \in(0,1)$ with probabilit o e.

THEOREM 3. Assume we have the following conditions (a)-(e):
(a) $n /(n+m) \in\left(c_{1}, c_{2}\right)$, for some universal constants $0<c_{1}<c_{2}<1$.
(b) There exists a universal constant $b>0$ such that

$$
\operatorname{mi}_{1 \leq j \leq p}\left[E\left\{\left(S_{n j}^{X}-n^{1 / 2} \mu_{j}^{X}\right)^{2}\right\}+E\left\{\left(S_{m j}^{Y}-m^{1 / 2} \mu_{j}^{Y}\right)^{2}\right\}\right] \geq b .
$$

(c) There exists a sequence of constants $B_{n, m} \geq 1$ such that

$$
\begin{aligned}
& \max _{1 \leq j \leq p} \sum_{i=1}^{n} E\left(\left|X_{i j}-\mu_{j}^{X}\right|^{k+2}\right) / n \leq B_{n, m}^{k}, \\
& \max _{1 \leq j \leq p} \sum_{i=1}^{m} E\left(\left|Y_{i j}-\mu_{j}^{Y}\right|^{k+2}\right) / m \leq B_{n, m}^{k},
\end{aligned}
$$

for all $k=1,2$.
(d) The sequence of constants $B_{n, m}$ defined in (c) also satisfies

$$
\begin{aligned}
& \max _{1 \leq i \leq n} \max _{1 \leq j \leq p} E\left\{\exp \left(\left|X_{i j}-\mu_{j}^{X}\right| / B_{n, m}\right)\right\} \leq 2, \\
& \max _{1 \leq i \leq m} \max _{1 \leq j \leq p} E\left\{\exp \left(\left|Y_{i j}-\mu_{j}^{Y}\right| / B_{n, m}\right)\right\} \leq 2 .
\end{aligned}
$$

(e) $B_{n, m}^{2} \log ^{7}(p n) / n \rightarrow 0$ as $n \rightarrow \infty$.

Then with probability one, the Kolmogorov distance between the distributions of the quantity $\left\|S_{n}^{X}-n^{1 / 2} m^{-1 / 2} S_{m}^{Y}-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)\right\|_{\infty}$ and the quantity $\left\|S_{n}^{S^{X}}-n^{1 / 2} m^{-1 / 2} S_{m}^{e Y}\right\|_{\infty}$ satisfies

$$
\begin{aligned}
& \sup _{t \geq 0} P\left(\left\|S_{n}^{X}-n^{1 / 2} m^{-1 / 2} S_{m}^{Y}-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)\right\|_{\infty} \leq t\right) \\
& \quad-P_{e}\left(\left\|S_{n}^{e X}-n^{1 / 2} m^{-1 / 2} S_{m}^{e Y}\right\|\right.
\end{aligned}
$$

It is eas to see that the computatio of the DCF test is of the order $O\{n(p+N)\}$, compared with $O(N n p)$ that is usuall dema ded b a ge eral resampli g method.

Accordi g to (6), the true power fu ctio for the test ca be formulated as

$$
\begin{equation*}
\operatorname{Power}\left(\mu^{X}-\mu^{Y}\right)=P\left\{\left\|S_{n}^{X}-n^{1 / 2} m^{-1 / 2} S_{m}^{Y}\right\|_{\infty} \geq c_{B}(\alpha) \mid \mu^{X}-\mu^{Y}\right\} \tag{7}
\end{equation*}
$$

To qua tif the power of the DCF test, the expressio (7) is ot directl applicable si ce the distributio of $\left(S_{n}^{X}-n^{1 / 2} m^{-1 / 2} S_{m}^{Y}\right.$ ) is u k ow. Motivated b Theorem 3, we propose a other multiplier bootstrap approximatio for $\operatorname{Power}\left(\mu^{X}-\mu^{Y}\right)$, based o a differe t set of sta dard ormal ra dom variables $e^{* n+m}=\left\{e_{1}^{*}, \ldots, e_{n+m}^{*}\right\}$ i depe de t of $e^{n+m}$ that are used to calculate $c_{B}(\alpha)$,

$$
\begin{align*}
& \operatorname{Power}^{*}\left(\mu^{X}-\mu^{Y}\right) \\
& \quad=P_{e^{*}}\left\{\left\|S_{n}^{e^{*} X}-n^{1 / 2} m^{-1 / 2} S_{m}^{e^{*} Y}+n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)\right\|_{\infty} \geq c_{B}(\alpha)\right\}, \tag{8}
\end{align*}
$$

where $S_{n}^{e^{*} X}$ a d $S_{m}^{e^{*} Y}$ are as de edi (3) with $e^{* n+m}$ i stead of $e^{n+m}$, a d $P_{e^{*}}(\cdot)$ mea s the probabilit with respect to $e^{* n+m}$ o 1 . The followi g theorem is devoted to establishi g the as mptotic equivale ce betwee $\operatorname{Power}\left(\mu^{X}-\mu^{Y}\right)$ a d $\operatorname{Power}^{*}\left(\mu^{X}-\mu^{Y}\right) \mathrm{u}$ der the same co ditio sas those i Theorem 3.

THEOREM 4. Assume the conditions (a)-(e) in Theorem 3 hold, then for any $\mu^{X}-\mu^{Y} \in$ $\mathbb{R}^{p}$, we have with probability one,

$$
\left|\operatorname{Power}^{*}\left(\mu^{X}-\mu^{Y}\right)-\operatorname{Power}\left(\mu^{X}-\mu^{Y}\right)\right| \lesssim\left\{B_{n, m}^{2} \log ^{7}(p n) / n\right\}^{1 / 6}
$$

B i spectio of the co ditio si Theorem 4, it is worth me tio ig that either sparsit or correlatio restrictio is required, as opposed to previous work requiri $g$ sparsit [3] for i sta ce. To appreciate this poi $t$, the as mptotic power $u$ der fairl ge eral alter atives speci ed b co ditio (f) is a al ed i the theorem below.

THEOREM 5. Assume the conditions (a)-(e) in Theorem 3 and that
(f) $\mathcal{F}_{n, m, p}=\left\{\mu^{X} \in \mathbb{R}^{p}, \mu^{Y} \in \mathbb{R}^{p}:\left\|\mu^{X}-\mu^{Y}\right\|_{\infty} \geq K_{s}\left\{B_{n, m} \log (p n) / n\right\}^{1 / 2}\right\}$, for a sufficiently large universal constant $K_{S}>0$.

Then for any $\mu^{X}-\mu^{Y} \in \mathcal{F}_{n, m, p}$, we have with probability tending to one,

$$
\operatorname{Power}^{*}\left(\mu^{X}-\mu^{Y}\right) \rightarrow 1 \quad \text { as } n \rightarrow \infty
$$

The set $\mathcal{F}_{n, m, p}$ i (f) imposes a lower bou do the separatio betwee $\mu^{X} \mathrm{ad} \mu^{Y}$, which is comparable to the assumptio $\max _{i}\left|\delta_{i} / \sigma_{i, i}^{1 / 2}\right| \geq\{2 \beta \log (p) / n\}^{1 / 2} \mathrm{i}$ Theorem 2 i [3]. The latter is $i$ fact a special case of co ditio (f) whe the seque ce $B_{n, m}$ is co sta $t$. It is worth me tio i g that the as mptotic power co verges to 1 u der either sparsit or correlatio assumptio si the co text of our theorem. I co trast, Theorem 2 i [3] requires ot o 1 sparse alter atives, but also restrictio so the correlatio structure, for example, co ditio 1 i that theorem such that the eige values of the correlatio matrix $\operatorname{diag}(\Sigma)^{-1 / 2} \Sigma \operatorname{diag}(\Sigma)^{-1 / 2}$ is lower bou ded $b$ a positive $u$ iversal co sta $t$. These compariso $s$ reveal that the proposed DCF is powerful for a broader ra ge of alter atives. We co clude this sectio $b$ oti $g$ that the theor for the DCF-t pe test based o $L_{2}$ - orm ca also be of i terest but is ot et established, which eeds further i vestigatio .
4. Simulation studies. I the two-sample test for high-dime sio al mea s, methods that are freque tl used a d/or rece tl proposed i clude those proposed b [5] (abbreviated as CQ, a $L_{2}$ orm test), [3] (abbreviated as CL, a $L_{\infty}$ orm test) a d [21] (abbreviated as XL, a test combi i g $L_{2}$ a d $L_{\infty}$ orms) tests. We co duct comprehe sive simulatio studies to compare our DCF test with these existi g methods i terms of si e a d power u der various setti gs. The two samples $X^{n}=\left\{X_{i}\right\}_{i=1}^{n}$ a d $Y^{m}=\left\{Y_{i}\right\}_{i=1}^{m}$ have si es $(n, m)$, while the data dime sio is chose to be $p=1000$. Without loss of ge eralit, we let $\mu^{X}=0 \in \mathbb{R}^{p}$. The structure of $\mu^{Y} \in \mathbb{R}^{p}$ is co trolled b a sig al stre gth parameter $\delta>0 \mathrm{a}$ d a sparsit level parameter $\beta \in[0,1]$. To co struct $\mu^{Y}$, i each sce ario, we rst ge erate a seque ce of i.i.d. ra dom variables $\theta_{k} \sim U(-\delta, \delta)$ for $k=1, \ldots, p$ a d keep them xed i the simulatio u der that sce ario. We set $\delta(r)=\{2 r \log (p) /(n \vee m)\}^{1 / 2}$ that gives appropriate scale of sig al stre gth $[3,5,28]$. We take $\mu^{Y}=\left(\theta_{1}, \ldots, \theta_{\lfloor\beta p\rfloor}, 0_{p-\lfloor\beta p\rfloor}^{\prime}\right)^{\prime} \in \mathbb{R}^{p}$, where $\lfloor a\rfloor$ de otes the earest i teger o more tha $a$, a d $0_{q}$ is the $q$-dime sio al vector of 0 's. Thus the sig al becomes sparser for a smaller value of $\beta$, with $\beta=0$ correspo di g to the ull h pothesis a d $\beta=1$ represe ti g the full de se alter ative. The covaria ce matrices of the ra dom vectors are de oted $\mathrm{b} \operatorname{cov}\left(X_{i}\right)=\Sigma^{X_{i}}, \operatorname{cov}\left(Y_{i^{\prime}}\right)=\Sigma^{Y_{i^{\prime}}}$ for all $i=1, \ldots, n, i^{\prime}=1, \ldots, m$. The omi al sig i ca ce level is $\alpha=0.05$, a d the DCF test is co ducted based o the multiplier bootstrap of si e $N=10^{4}$.

To have comprehe sive compariso, we rst co sider the followi $g$ six differe $t$ setti gs. The rst setti g is sta dard with $(n, m, p)=(200,300,1000)$, where the eleme ts i each sample are i.i.d. Gaussia , a d the two samples share a commo covaria ce ma$\operatorname{trix} \Sigma=\left(\Sigma_{j k}\right)_{1 \leq j, k \leq p}$. The matrix $\Sigma$ is speci ed b a depe de ce structure such that $\Sigma_{j k}=(1+|j-k|)^{-1} / 4$. Begi i g with $\delta=0.1$, where the implicit chose value $r=0.217$ correspo ds to quite weak sig al accordi g to [3,28], we calculate the rejectio proportio s of the four tests based o 1000 Mo te Carlo ru s over a full ra ge of sparsit levels from $\beta=0$ (correspo di g to ull h pothesis) to $\beta=1$ (correspo di g to full de se alter ative). The the the sig als are graduall stre gthe ed to $\delta=0.15,0.2,0.25,0.3$. The seco d setti g is similar to the rst , except for $\Sigma^{Y_{i}}=2 \Sigma^{X^{\prime}}=2 \Sigma$ for all $i=1, \ldots, n, i^{\prime}=1, \ldots, m$, where $\Sigma$ is de ed i the rst setti $g$. These two setti gs are de oted b i.i.d. equal (resp., u equal) covaria ce setti g.-

I the third setti $g$, the ra dom vectors i each sample have completel differe $t$ distributio s a d covaria ce matrices from o e a other. The procedure to ge erate the two samples is as follows. First, a set of parameters $\left\{\phi_{i j}: i=1, \ldots, m, j=1, \ldots, p\right\}$ are ge erated from the u iform distributio $U(1,2)$ i depe de tl , a d are kept xed for all Mo te Carlo ru s. I a similar fashio , $\left\{\phi_{i j}^{*}: i=1, \ldots, m, j=1, \ldots, p\right\}$ are ge erated from $U(1,3)$ i depe de tl. The , for ever $i=1, \ldots, n$, we de e a $p \times p$ matrix $\Omega_{i}=\left(\omega_{i j k}\right)_{1 \leq j, k \leq p}$ with each $\omega_{i j k}=\left(\phi_{i j} \phi_{i k}\right)^{1 / 2}(1+|j-k|)^{-1 / 4}$. Likewise, for ever $i=1, \ldots, m$, de e a $p \times p$ matrix $\Omega_{i}^{*}=\left(\omega_{i j k}^{*}\right)_{1 \leq j, k \leq p}$ with each $\omega_{i j k}^{*}=\left(\phi_{i j}^{*} \phi_{i k}^{*}\right)^{1 / 2}(1+|j-k|)^{-1 / 4}$. Subseque tl, we ge erate a set of i.i.d. ra dom vectors $\breve{X}^{n}=\left\{\breve{X}_{i}\right\}_{i=1}^{n}$ with each $\breve{X}_{i}=\left(\breve{X}_{i 1}, \ldots, \breve{X}_{i p}\right)^{\prime} \in \mathbb{R}^{p}$, such that $\left\{\breve{X}_{i 1}, \ldots, \breve{X}_{i, 2 p / 5}\right\}$ are i.i.d. sta dard ormal ra dom variables, $\left\{\breve{X}_{i, 2 p / 5+1}, \ldots, \breve{X}_{i, p}\right\}$ are i.i.d. ce tered $\operatorname{Gamma}(16,1 / 4)$ ra dom variables, a d the are i depe de tof each other. Accordi gl , we co struct each $X_{i}$ b letti $\mathrm{g} X_{i}=\mu^{X}+\Omega_{i}^{1 / 2} \breve{X}_{i}$ for all $i=1, \ldots, n$. It is worth oti g that $\Sigma^{X_{i}}=\Omega_{i}$ for all $i=1, \ldots, n$, that is, $X_{i}$ 's have differe t covaria ce matrices a d distributio s. The other sample $Y^{m}=\left\{Y_{i}\right\}_{i=1}^{m}$ is co structed i the same wa with $\Sigma^{Y_{i}}=\Omega_{i}^{*}$ for all $i=1, \ldots, m$. The we obtai ed the results for various sig al stre gth levels of $\delta$ over a full ra ge of sparsit levels of $\beta$, a d we de ote this setti g as completel relaxed._ The fourth setti g is a alogous to the third, except that we set $(n, m, p)=(100,400,1000)$, where two sample si es deviates substa tiall from each other. Si ce this setti g is co cer ed with highl $u$ equal sample si es, a d is therefore de oted as completel relaxed a dhighl u equal setti g.- The fth setti g is similar to the third, except that we replace the sta dard
ormal i ovatio si $\breve{X}_{i}$ a d $\breve{Y}_{i^{\prime}}$ b i depe de ta dheav -tailed i ovatio s $(5 / 3)^{-1 / 2} t(5)$ with mea ero a du it varia ces, referred to as completel relaxed a d heav -tailed setti g. The sixth setti g is also a alogous to the third, while i depe de t a d skewed i ovatio $s 8^{-1 / 2}\left\{\chi^{2}(4)-4\right\}$ with mea ero a $d u$ it varia ces are used, de oted $b$ completel relaxed a d skewed setti g.-

We co duct the four tests a d calculate the rejectio proportio s to assess the empirical power at differe t sig al levels $\delta$ a d sparsit levels $\beta$ i each setti g as described above, based o 1000 Mo te Carlo ru s. The umerical results of these six setti gs are show i Tables 12 . For visuali atio, we depict the empirical power plots of all setti gs i Figure 1. We also displa the multiplier bootstrap approximatio based o a other i depe de t set of si e $N=10^{4}$, which agrees well with the empirical si e/power of the DCF test a d justi es the theoretical assessme t i Theorem 4. We see that the empirical si es of proposed DCF test agree well with the omi al level 0.05 i all six setti gs . B compariso, the CQ test is ot as stable, a d the CL a d XL tests show $u$ derestimatio of $t$ pe I error $i$ all setti gs.
Regardi g power performa ce $u$ der alter atives $i$ these six setti gs, despite all tests sufferi g low power for the weak sig als $\delta=0.1$ a $\mathrm{d} \delta=0.15$, the DCF test still domi ates the other tests at all levels of $\beta$. Whe the sig al stre gth rises to $\delta=0.2$, the results i Setti g I i dicate that the DCF test outperforms the other tests, except for the CQ test whe $\beta \geq 80 \%$ (a ver de se alter ative). Although the power of CQ test i creases above that of DCF test at $\beta=80 \%$, the gai s are ot substa tial whe both tests have high power. Similar patter s are observed i Setti gs II, III, V, VI with $\delta=0.25$ for $\beta$ ra gi g betwee $80 \%$ a d $83 \%$, a d Setti gs III, IV with $\delta=0.3$ for $\beta$ at $80 \%$ a d $90 \%$, respectivel. This phe ome o is visuall show i the power plot i Figure 1. It is also oted the DCF test domi ates the CL ( $L_{\infty} \mathrm{t}$ pe) a d XL (combi ed t pe) u iforml i these setti gs over all levels of $\delta \mathrm{a} \mathrm{d} \beta$. To summari e, except for the rapidl i creased power of CQ test i ver de se alter atives, the DCF test outperforms the other tests over various sig al levels of $\delta$ i a broad ra ge of sparsit levels $\beta$, for alter atives with varied mag itudes a d sig s. Moreover, the gai s are sustai able i the situatio s that the data structures get more complex, for example, highl u bala ced si es, heav -tailed or skewed distributio s.

We further exami e alter atives with commo / xed sig al upo reviewer's request u der the completel relaxed setti g , de oted b Setti g VII, where we let $\mu^{Y}=$ $\delta\left(1, \ldots, 1_{\lfloor\beta p\rfloor}, 0_{p-\lfloor\beta p\rfloor}^{\prime}\right)^{\prime}$

Table 1
Rejection proportions (\%) calculated for four testing methods at different signal strength levels of $\delta$ and sparsity levels of $\beta$ based on 1000 Monte Carlo runs, where $\beta=0$ corresponds to the null hypothesis $\beta=1$ to the fully dense alternative, and $(n, m, p)=(200,300,1000)$

500 bootstrapped datasets are give i Table 3, which shows that the highest rejectio proportio amo $g$ the four tests is achieved b DCF at $82 \%$. This is i li e with the smallest a d sig i ca $\mathrm{t} p$-value give b the DCF test based o the dataset itself. We also perform 500 ra dom permutatio s of the whole dataset (i.e., mixi g up two groups that elimi ate the group differe ce) a d co duct four tests over each permuted dataset. From Table 3, we see that the rejectio proportio of the DCF test (0.046) is close to the omi al level $\alpha=0.05$, while those of the other tests differ co siderabl .

## APPENDIX

We rst prese t some auxiliar lemmas that are ke for derivi g the mai theorems. To i troduce Lemma 1, for a $\beta>0$ a d $y \in \mathbb{R}^{p}$, we de e a fu ctio $F_{\beta}(w)$ as

$$
F_{\beta}(w)=\beta^{-1} \log \left[\sum_{j=1}^{p} \exp \left\{\beta\left(w_{j}-y_{j}\right)\right\}\right], \quad w \in \mathbb{R}^{p}
$$

which satis es the propert

$$
0 \leq F_{\beta}(w)-\max _{1 \leq j \leq p}\left(w_{j}-y_{j}\right) \leq \beta^{-1} \log p
$$

for ever $w \in \mathbb{R}^{p} \mathrm{~b}$ (1) i [8]. I additio, we let $\varphi_{0}: \mathbb{R} \rightarrow[0,1]$ be a real valued fu ctio such that $\varphi_{0}$ is thrice co ti uousl differe tiable a $\mathrm{d} \varphi_{0}(z)=1$ for $z \leq 0$ a d $\varphi_{0}(z)=0$ for $z \geq 1$. For a $\quad \phi \geq 1$, de e a fu ctio $\varphi(z)=\varphi_{0}(\phi z), z \in \mathbb{R}$. The, for a $\quad \phi \geq 1 \mathrm{ad}$ $y \in \mathbb{R}^{p}$, de ote $\beta=\phi \log p$ a d de e a fu ctio $\kappa: \mathbb{R}^{p} \rightarrow[0,1]$ as

$$
\begin{equation*}
\kappa(w)=\varphi_{0}\left(\phi F_{\phi \log p}(w)\right)=\varphi\left(F_{\beta}(w)\right), \quad w \in \mathbb{R}^{p} . \tag{9}
\end{equation*}
$$

Lemma 1 is devoted to characteri e the properties of the fu ctio $\kappa$ de ed i (9), which ca be also referred to Lemmas A. 5 a d A. 6 i [7].

Lemma 1. For any $\phi \geq 1$ and $y \in \mathbb{R}^{p}$, we denote $\beta=\phi \log p$, then the function $\kappa$ defined in (9) has the following properties, where $\kappa_{j k l}$ denotes $\partial_{j} \partial_{k} \partial_{l} \kappa$. For any $j, k, l=1, \ldots, p$, there exists a nonnegative function $Q_{j k l}$ such that:
(1) $\left|\kappa_{j k l}(w)\right| \leq Q_{j k l}(w)$ for all $w \in \mathbb{R}^{p}$,
(2) $\sum_{j=1}^{p} \sum_{k=1}^{p} \sum_{l=1}^{p} Q_{j k l}(w) \lesssim\left(\phi^{3}+\phi^{2} \beta+\phi \beta^{2}\right) \lesssim \phi \beta^{2}$ for all $w \in \mathbb{R}^{p}$,
(3) $Q_{j k l}(w) \lesssim Q_{j k l}(w+\tilde{w}) \lesssim Q_{j k l}(w)$ for all $w \in \mathbb{R}^{p}$ and $\tilde{w} \in\left\{w^{*} \in \mathbb{R}^{p}\right.$ : $\left.\max _{1 \leq j \leq p}\left|w_{j}^{*}\right| \beta \leq 1\right\}$.

To state Lemma 2, a two-sample exte sio of Lemma 5.1 i [9], for a seque ce of co sta ts $\delta_{n, m}$ that depe ds o both $n$ a d $m$, we de ote the qua tit $\rho_{n, m} \mathrm{~b}$

$$
\begin{align*}
\rho_{n, m} & =\sup _{v \in[0,1]} \sup _{y \in \mathbb{R}^{p}} \mid P\left\{v^{1 / 2}\left(S_{n}^{X}-n^{1 / 2} \mu^{X}+\delta_{n, m} S_{m}^{Y}-\delta_{n, m} m^{1 / 2} \mu^{Y}\right)\right. \\
& \left.+(1-v)^{1 / 2}\left(S_{n}^{F}-n^{1 / 2} \mu^{X}+\delta_{n, m} S_{m}^{G}-\delta_{n, m} m^{1 / 2} \mu^{Y}\right) \leq y\right\}  \tag{10}\\
& -P\left(S_{n}^{F}-n^{1 / 2} \mu^{X}+\delta_{n, m} S_{m}^{G}-\delta_{n, m} m^{1 / 2} \mu^{Y} \leq y\right) \mid
\end{align*}
$$

Lemma 2 provides a bou do $\rho_{n, m} \mathrm{u}$ der some ge eral co ditio s .

LEMMA 2. For any $\phi_{1}, \phi_{2} \geq 1$ and any sequence of constants $\delta_{n, m}$, assume the following condition (a) holds,
(a) There exists a universal constant $b>0$ such that

$$
\operatorname{mi}_{1 \leq j \leq p} E\left\{\left(S_{n j}^{X}-n^{1 / 2} \mu_{j}^{X}+\delta_{n, m} S_{m j}^{Y}-\delta_{n, m} m^{1 / 2} \mu_{j}^{Y}\right)^{2}\right\} \geq b .
$$

Then we have

$$
\rho_{n, m} \lesssim n^{-1 / 2} \phi_{1}^{2}(\log p)
$$

Then we have

$$
\begin{aligned}
\rho_{n, m}^{*} \leq & K^{*}\left[n^{-1 / 2} \phi_{1}^{2}(\log p)^{2}\left\{\phi_{1} L_{n}^{X} \rho_{n, m}^{*}+L_{n}^{X}(\log p)^{1 / 2}+\phi_{1} M_{n}\left(\phi_{1}\right)\right\}\right. \\
& +m^{-1 / 2} \phi_{2}^{2}(\log p)^{2}\left|\delta_{n, m}\right|^{3}\left\{\phi_{2} L_{m}^{Y} \rho_{n, m}^{*}+L_{m}^{Y}(\log p)^{1 / 2}+\phi_{2} M_{m}^{*}\left(\phi_{2}\right)\right\} \\
& \left.+\left(\operatorname{mi}\left\{\phi_{1}, \phi_{2}\right\}\right)^{-1}(\log p)^{1 / 2}\right],
\end{aligned}
$$

up to a universal constant $K^{*}>0$ that depends only on $b$, where $\rho_{n, m}^{*}$ is defined in (11).
Before stati g the ext lemma, for a $\quad \phi \geq 1$, we de ote $M_{n}(\phi)=M_{n}^{X}(\phi)+M_{n}^{F}(\phi)$, where $M_{n}^{X}(\phi)$ a d $M_{n}^{F}(\phi)$ are give as follows, respectivel ,

$$
\begin{aligned}
& n^{-1} \sum_{i=1}^{n} E\left[\max _{1 \leq j \leq p}\left|X_{i j}-\mu_{j}^{X}\right|^{3} 1\left\{\max _{1 \leq j \leq p}\left|X_{i j}-\mu_{j}^{X}\right|>n^{1 / 2} /(4 \phi \log p)\right\}\right] \\
& n^{-1} \sum_{i=1}^{n} E\left[\max _{1 \leq j \leq p}\left|F_{i j}-\mu_{j}^{F}\right|^{3} 1\left\{\max _{1 \leq j \leq p}\left|F_{i j}-\mu_{j}^{F}\right|>n^{1 / 2} /(4 \phi \log p)\right\}\right]
\end{aligned}
$$

similar to those adopted i [9]. Likewise, for a $\quad \phi \geq 1 \mathrm{a}$ da seque ce of co sta ts $\delta_{n, m}$ that depe ds o both $n$ a d $m$, we de ote $M_{m}^{*}(\phi)=M_{m}^{Y}(\phi)+M_{m}^{G}(\phi)$ with $M_{m}^{Y}(\phi)$ a d $M_{m}^{G}(\phi)$ as follows, respectivel ,

$$
\begin{aligned}
& m^{-1} \sum_{i=1}^{m} E\left[\max _{1 \leq j \leq p}\left|Y_{i j}-\mu_{j}^{Y}\right|^{3} 1\left\{\max _{1 \leq j \leq p}\left|Y_{i j}-\mu_{j}^{Y}\right|>m^{1 / 2} /\left(4\left|\delta_{n, m}\right| \phi \log p\right)\right\}\right] \\
& m^{-1} \sum_{i=1}^{m} E\left[\max _{1 \leq j \leq p}\left|G_{i j}-\mu_{j}^{G}\right|^{3} 1\left\{\max _{1 \leq j \leq p}\left|G_{i j}-\mu_{j}^{G}\right|>m^{1 / 2} /\left(4\left|\delta_{n, m}\right| \phi \log p\right)\right\}\right]
\end{aligned}
$$

Recalli g the de itio of $\rho_{n, m}^{* *} \mathrm{i}$ (2), Lemma 4 gives a abstract upper bou do $\rho_{n, m}^{* *}$ u der mild co ditio s as follows.

LEMMA 4. For any sequence of constants $\delta_{n, m}$, assume we have the following conditions (a)-(b):
(a) There exists a universal constant $b>0$ such that

$$
\operatorname{mi}_{1 \leq j \leq p} E\left\{\left(S_{n j}^{X}-n^{1 / 2} \mu_{j}^{X}+\delta_{n, m} S_{m j}^{Y}-\delta_{n, m} m^{1 / 2} \mu_{j}^{Y}\right)^{2}\right\} \geq b .
$$

(b) There exist two sequences of constants $\bar{L}_{n}^{*}$ and $\bar{L}_{m}^{* *}$ such that we have $\bar{L}_{n}^{*} \geq L_{n}^{X}$ and $\bar{L}_{m}^{* *} \geq L_{m}^{Y}$, respectively. Moreover, we also have

$$
\begin{aligned}
\phi_{n}^{*} & =K_{1}\left\{\left(\bar{L}_{n}^{*}\right)^{2}(\log p)^{4} / n\right\}^{-1 / 6} \geq 2 \\
\phi_{m}^{* *} & =K_{1}\left\{\left(\bar{L}_{m}^{* *}\right)^{2}(\log p)^{4}\left|\delta_{n, m}\right|^{6} / m\right\}^{-1 / 6} \geq 2
\end{aligned}
$$

for a universal constant $K_{1} \in\left(0,\left(K^{*} \vee 2\right)^{-1}\right]$, where the positive constant $K^{*}$ that depends on $n$ as defined in Lemma 3 in the Appendix.

Then we have the following property, where $\rho_{n, m}^{* *}$ is defined in (2),

$$
\begin{aligned}
\rho_{n, m}^{* *} \leq & K_{2}\left[\left\{\left(\bar{L}_{n}^{*}\right)^{2}(\log p)^{7} / n\right\}^{1 / 6}+\left\{M_{n}\left(\phi_{n}^{*}\right) / \bar{L}_{n}^{*}\right\}\right. \\
& \left.+\left\{\left(\bar{L}_{m}^{* *}\right)^{2}(\log p)^{7}\left|\delta_{n, m}\right|^{6} / m\right\}^{1 / 6}+\left\{M_{m}^{*}\left(\phi_{m}^{* *}\right) / \bar{L}_{m}^{* *}\right\}\right]
\end{aligned}
$$

for a universal constant $K_{2}>0$ that depends only on $b$.

To i troduce Lemma 5, for a seque ce of co sta ts $\delta_{n, m}$ that depe ds o both $n$ a d $m$, de ote a useful qua tit $\hat{\Delta}_{n, m}=\left\|\hat{\Sigma}^{X}-\Sigma^{X}+\delta_{n, m}^{2}\left(\hat{\Sigma}^{Y}-\Sigma^{Y}\right)\right\|_{\infty}$. Lemma 5 below gives a abstract upper bou do $\rho_{n, m}^{M B}$ de edi (4).

LEMMA 5. For any sequence of constants $\delta_{n, m}$, assume we have the following condition (a):
(a) There exists a universal constant $b>0$ such that

$$
\operatorname{mi}_{1 \leq j \leq p} E\left\{\left(S_{n j}^{X}-n^{1 / 2} \mu_{j}^{X}+\delta_{n, m} S_{m j}^{Y}-\delta_{n, m} m^{1 / 2} \mu_{j}^{Y}\right)^{2}\right\} \geq b .
$$

Then for any sequence of constants $\bar{\Delta}_{n, m}>0$, on the event $\left\{\hat{\Delta}_{n, m} \leq \bar{\Delta}_{n, m}\right\}$, we have the following property, where $\rho_{n, m}^{M B}$ is defined in (4),

$$
\rho_{n, m}^{M B} \lesssim\left(\bar{\Delta}_{n, m}\right)^{1 / 3}(\log p)^{2 / 3} .
$$

Lastl, we prese t two-sample Borel Ca telli lemma i Lemma 6.
LEMMA 6. Let $\left\{A_{n, m}: n \geq 1, m \geq 1,(n, m) \in A\right\}$ be a sequence of events in the sample space $\Omega$, where $A$ is the set of all possible combinations $(n, m)$, which has the form $A=$ $\{(n, m): n \geq 1, m \in \sigma(n)\}$ where $\sigma(n)$ is a set of positive integers determined by $n$, possibly the empty set. Assume the following condition (a):
(a) $\sum_{n=1}^{\infty} \sum_{m \in \sigma(n)} P\left(A_{n, m}\right)<\infty$.

Then we have the following property:

$$
P\left(\bigcap_{k_{1}=1}^{\infty} \bigcap_{k_{2}=1}^{\infty} \bigcup_{n=k_{1}}^{\infty} \bigcup_{m \in \varrho\left(k_{2}\right) \cap \sigma(n)} A_{n, m}\right)=0,
$$

where $\varrho\left(k_{2}\right)=\left\{k: k \in \mathbb{Z}, k \geq k_{2}\right\}$.
Note that if $m \in \sigma(n)=\varnothing$, we just delete the roles of those $A_{n, m}$ a d $A_{n, m}^{c}$ duri g a operatio s such as u io a d i tersectio, a d the same applies to $P\left(A_{n, m}\right)$ a d $P\left(A_{n, m}^{c}\right)$ duri $g$ summatio a deductio .

Before precedi g , we me tio that the derivatio s of Theorems 12 esse tiall follow those of their cou terparts i [9], but eed more tech icalit to emplo the aforesaid Lemmas 45 to address the challe ge arisi g from u equal sample si es. The derivatio of Corollar 1 is based o Theorem 1 as well as a two-sample Borel Ca telli lemma (Lemma 6) that rst appears i this work as far as we k ow.

Theorems 35 regardi $g$ the DCF test are ewl developed, while o comparable results are prese ti literature. Thus we prese t the proofs of Theorems 35 below, while the proofs of Theorems 1 2, Corollar 1 a d the auxiliar lemmas are delegated to a o li e Suppleme tar Material for space eco om .

Proof of Theorem 3. First of all, we de e a seque ce of co sta ts $\delta_{n, m} \mathrm{~b}$

$$
\begin{equation*}
\delta_{n, m}=-n^{1 / 2} m^{-1 / 2} \tag{12}
\end{equation*}
$$

Together with co ditio (a), it ca deduced that

$$
\begin{equation*}
\delta_{2}<\left|\delta_{n, m}\right|<\delta_{1} \tag{13}
\end{equation*}
$$

with $\delta_{1}=\left\{c_{2} /\left(1-c_{2}\right)\right\}^{1 / 2}>0$ a d $\delta_{2}=\left\{c_{1} /\left(1-c_{1}\right)\right\}^{1 / 2}>$

Proof of Theorem 4. Give a $\quad\left(\mu^{X}-\mu^{Y}\right)$, we have

$$
\begin{aligned}
& \operatorname{Power}^{*}\left(\mu^{X}-\mu^{Y}\right) \\
&= P_{e^{*}}\left\{\left\|S_{n}^{e^{*} X}-n^{1 / 2} m^{-1 / 2} S_{m}^{e^{*} Y}+n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)\right\|_{\infty} \geq c_{B}(\alpha)\right\} \\
&= 1-P_{e^{*}}\left\{\left\|S_{n}^{e^{*} X}-n^{1 / 2} m^{-1 / 2} S_{m}^{e^{*} Y}+n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)\right\|_{\infty}<c_{B}(\alpha)\right\} \\
&= 1-P_{e^{*}}\left\{-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)-c_{B}(\alpha)<S_{n}^{e^{*} X}-n^{1 / 2} m^{-1 / 2} S_{m}^{e^{*} Y}<\right. \\
&\left.-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)+c_{B}(\alpha)\right\} \\
&= 1-P_{e^{*}}\left\{-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)-c_{B}(\alpha)<S_{n}^{e^{*} X}-n^{1 / 2} m^{-1 / 2} S_{m}^{e^{*} Y}<\right. \\
&\left.-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)+c_{B}(\alpha)\right\} \\
&+P\left\{-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)-c_{B}(\alpha)<S_{n}^{X}-n^{1 / 2} m^{-1 / 2} S_{m}^{Y}\right. \\
&\left.-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)<-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)+c_{B}(\alpha)\right\} \\
&-P\left\{-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)-c_{B}(\alpha)<S_{n}^{X}-n^{1 / 2} m^{-1 / 2} S_{m}^{Y}\right. \\
&\left.-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)<-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)+c_{B}(\alpha)\right\} \\
& \geq 1-\sup _{A \in \mathcal{A}^{\mathrm{Re}}} \mid P\left(\| S_{n}^{X}-n^{1 / 2} m^{-1 / 2} S_{m}^{Y}\right. \\
&\left.-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right) \|_{\infty} \in A\right)-P_{e^{*}}\left(\left\|S_{n}^{e^{*} X}-n^{1 / 2} m^{-1 / 2} S_{m}^{e^{*} Y}\right\|_{\infty} \in A\right) \mid \\
&-P\left\{\left\|S_{n}^{X}-n^{1 / 2} m^{-1 / 2} S_{m}^{Y}\right\|_{\infty}<c_{B}(\alpha)\right\} \\
&= \operatorname{Power}\left(\mu^{X}-\mu^{Y}\right) \\
&-\sup \mid P\left(\left\|S_{n}^{X}-n^{1 / 2} m^{-1 / 2} S_{m}^{Y}-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)\right\|_{\infty} \in A\right) \\
&-P_{e^{*}}\left(\left\|S_{n}^{e^{*} X}-n^{1 / 2} m^{-1 / 2} S_{m}^{e^{*} Y}\right\|_{\infty} \in A\right) \mid .
\end{aligned}
$$

Likewise, give a $\quad\left(\mu^{X}-\mu^{Y}\right)$, we have

$$
\begin{aligned}
& \operatorname{Power}\left(\mu^{X}-\mu^{Y}\right) \\
&= P\left\{\left\|S_{n}^{X}-n^{1 / 2} m^{-1 / 2} S_{m}^{Y}\right\|_{\infty} \geq c_{B}(\alpha)\right\} \\
&= 1-P\left\{\left\|S_{n}^{X}-n^{1 / 2} m^{-1 / 2} S_{m}^{Y}\right\|_{\infty}<c_{B}(\alpha)\right\} \\
&= 1-P\left\{-c_{B}(\alpha)<S_{n}^{X}-n^{1 / 2} m^{-1 / 2} S_{m}^{Y}<c_{B}(\alpha)\right\} \\
&= 1+P_{e^{*}}\left\{-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)-c_{B}(\alpha)<S_{n}^{e^{*} X}-n^{1 / 2} m^{-1 / 2} S_{m}^{e^{*} Y}<\right. \\
&\left.-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)+c_{B}(\alpha)\right\}-P\left\{-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)-c_{B}(\alpha)\right. \\
&\left.<S_{n}^{X}-n^{1 / 2} m^{-1 / 2} S_{m}^{Y}-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)<-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)+c_{B}(\alpha)\right\} \\
&-P_{e^{*}}\left\{-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)-c_{B}(\alpha)<S_{n}^{e^{*} X}-n^{1 / 2} m^{-1 / 2} S_{m}^{e^{*} Y}\right. \\
&\left.<-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)+c_{B}(\alpha)\right\} \\
& \geq 1-\sup \mid P\left(\left\|S_{n}^{X}-n^{1 / 2} m^{-1 / 2} S_{m}^{Y}-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)\right\|_{\infty} \in A\right) \\
& \quad-P_{e^{*}}\left(\left\|S_{n}^{e^{*} X}-n^{1 / 2} m^{-1 / 2} S_{m}^{e^{*} Y}\right\|_{\infty} \in A\right) \mid
\end{aligned}
$$

$$
\begin{aligned}
& -P_{e^{*}}\left\{\left\|S_{n}^{e^{*} X}-n^{1 / 2} m^{-1 / 2} S_{m}^{e^{*} Y}+n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)\right\|_{\infty}<c_{B}(\alpha)\right\} \\
= & \operatorname{Power}^{*}\left(\mu^{X}-\mu^{Y}\right) \\
& -\sup _{A \in \mathcal{A}^{\operatorname{Re}}} \mid P\left(\left\|S_{n}^{X}-n^{1 / 2} m^{-1 / 2} S_{m}^{Y}-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)\right\|_{\infty} \in A\right) \\
& -P_{e^{*}}\left(\left\|S_{n}^{e^{*} X}-n^{1 / 2} m^{-1 / 2} S_{m}^{e^{*} Y}\right\|_{\infty} \in A\right) \mid .
\end{aligned}
$$

Putti $g$ (22) a d (23) together i dicates that

$$
\begin{align*}
& \left|\operatorname{Power}^{*}\left(\mu^{X}-\mu^{Y}\right)-\operatorname{Power}\left(\mu^{X}-\mu^{Y}\right)\right| \\
& \quad \leq \sup _{A \in \mathcal{A}^{\mathrm{Re}}} \mid P\left(\left\|S_{n}^{X}-n^{1 / 2} m^{-1 / 2} S_{m}^{Y}-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)\right\|_{\infty} \in A\right)  \tag{24}\\
& \quad-P_{e^{*}}\left(\left\|S_{n}^{e^{*} X}-n^{1 / 2} m^{-1 / 2} S_{m}^{e^{*} Y}\right\|_{\infty} \in A\right) \mid .
\end{align*}
$$

Moreover, b similar argume t as i the proof of Theorem 3, o e ca show that with probabilit o e,

$$
\begin{array}{rl}
\sup _{A \in \mathcal{A}^{\mathrm{Re}}} & P\left(\left\|S_{n}^{X}-n^{1 / 2} m^{-1 / 2} S_{m}^{Y}-n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)\right\|_{\infty} \in A\right) \\
& -P_{e^{*}}\left(\left\|S_{n}^{e^{*} X}-n^{1 / 2} m^{-1 / 2} S_{m}^{e^{*} Y}\right\|_{\infty} \in A\right) \mid  \tag{25}\\
\lesssim & \left\{B_{n, m}^{2} \log ^{7}(p n) / n\right\}^{1 / 6} .
\end{array}
$$

Fi all, b combi i $g$ (24) with (25), for a $\mu^{X}-\mu^{Y} \in \mathbb{R}^{p}$, we have that with probabilit o e,

$$
\left|\operatorname{Power}^{*}\left(\mu^{X}-\mu^{Y}\right)-\operatorname{Power}\left(\mu^{X}-\mu^{Y}\right)\right| \lesssim\left\{B_{n, m}^{2} \log ^{7}(p n) / n\right\}^{1 / 6}
$$

which completes the proof.
Proof of Theorem 5. First of all, o the basis of (8) a d the tria gle i equalit, it is clear that

$$
\begin{align*}
\operatorname{Power}^{*}\left(\mu^{X}-\mu^{Y}\right) \geq & P_{e^{*}}\left\{\left\|S_{n}^{e^{*} X}-n^{1 / 2} m^{-1 / 2} S_{m}^{e^{*} Y}\right\|_{\infty}\right.  \tag{26}\\
& \left.\leq\left\|n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)\right\|_{\infty}-c_{B}(\alpha)\right\} .
\end{align*}
$$

At this poi t , with some abuse of otatio, we de ote $\left\{e_{j}: j \leq p\right\}$ as the atural basis for $\mathbb{R}^{p}$. The it follows from $u$ io bou di equalit a d co ce tratio i equalit that for a $t \geq 0$,

$$
\begin{aligned}
P_{e^{*}} & \left\{\left\|S_{n}^{e^{*} X}-n^{1 / 2} m^{-1 / 2} S_{m}^{e^{*} Y}\right\|_{\infty} \geq t\right\} \\
& \leq \sum_{j=1}^{p} P_{e^{*}}\left\{\left|S_{n j}^{e^{*} X}-n^{1 / 2} m^{-1 / 2} S_{m j}^{e^{*} Y}\right| \geq t\right\} \\
& \leq \sum_{j=1}^{p} 2 \exp \left[-t^{2} /\left\{2 e_{j}^{\prime}\left(\hat{\Sigma}^{X}+n m^{-1} \hat{\Sigma}^{Y}\right) e_{j}\right\}\right] \\
& \leq 2 p \exp \left(-t^{2} /\left[2 \max _{j \leq p}\left\{e_{j}^{\prime}\left(\hat{\Sigma}^{X}+n m^{-1} \hat{\Sigma}^{Y}\right) e_{j}\right\}\right]\right) .
\end{aligned}
$$

B pluggi $\mathrm{g} t=c_{B}(\alpha)$ i to (27), it follows from the de itio of $c_{B}(\alpha)$ that

$$
\begin{align*}
c_{B}(\alpha) & \leq\left[2 \log (2 p / \alpha) \max _{j \leq p}\left\{e_{j}^{\prime}\left(\hat{\Sigma}^{X}+n m^{-1} \hat{\Sigma}^{Y}\right) e_{j}\right\}\right]^{1 / 2} \\
& \leq\left[4 \log (p n) \max _{j \leq p}\left\{e_{j}^{\prime}\left(\hat{\Sigma}^{X}+n m^{-1} \hat{\Sigma}^{Y}\right) e_{j}\right\}\right]^{1 / 2}, \tag{28}
\end{align*}
$$

for suf cie tl large $n$. To bou d the qua tit $\max _{j \leq p}\left\{e_{j}^{\prime}\left(\hat{\Sigma}^{X}+n m^{-1} \hat{\Sigma}^{Y}\right) e_{j}\right\}$, rst otice that

$$
\begin{align*}
& \max _{j \leq p}\left\{e_{j}^{\prime}\left(\hat{\Sigma}^{X}+n m^{-1} \hat{\Sigma}^{Y}\right) e_{j}\right\} \\
& \quad=\left\|\hat{\Sigma}^{X}+n m^{-1} \hat{\Sigma}^{Y}\right\|_{\infty}  \tag{29}\\
& \quad \leq\left\|\hat{\Sigma}^{X}-\Sigma^{X}+n m^{-1}\left(\hat{\Sigma}^{Y}-\Sigma^{Y}\right)\right\|_{\infty}+\left\|\Sigma^{X}+n m^{-1} \Sigma^{Y}\right\|_{\infty}
\end{align*}
$$

For the term $\left\|\hat{\Sigma}^{X}-\Sigma^{X}+n m^{-1}\left(\hat{\Sigma}^{Y}-\Sigma^{Y}\right)\right\|_{\infty}$, i equalities (53) a d (54) from the Suppleme tar Material together with (12), (17) a d co ditio (a) e tails that there exists a u iversal co sta $\mathrm{t} c_{1}>0$ such that

$$
\begin{equation*}
\left\|\hat{\Sigma}^{X}-\Sigma^{X}+n m^{-1}\left(\hat{\Sigma}^{Y}-\Sigma^{Y}\right)\right\|_{\infty} \leq c_{1}\left\{B_{n, m}^{2} \log ^{3}(p n) / n\right\}^{1 / 2} \tag{30}
\end{equation*}
$$

with probabilit te di g to o e. Regardi g the term $\left\|\Sigma^{X}+n m^{-1} \Sigma^{Y}\right\|_{\infty}$, o e has

$$
\begin{aligned}
\| \Sigma^{X} & +n m^{-1} \Sigma^{Y} \|_{\infty} \\
\leq & \left\|\Sigma^{X}\right\|_{\infty}+n m^{-1}\left\|\Sigma^{Y}\right\|_{\infty} \leq\left\|\Sigma^{X}\right\|_{\infty}+c_{2}\left\|\Sigma^{Y}\right\|_{\infty} \\
= & \max _{1 \leq j \leq p} \sum_{i=1}^{n} E\left\{\left(X_{i j}-\mu_{j}^{X}\right)^{2}\right\} / n+c_{2} \max _{1 \leq j \leq p} \sum_{i=1}^{m} E\left\{\left(Y_{i j}-\mu_{j}^{Y}\right)^{2}\right\} / m \\
\leq & \max _{1 \leq j \leq p} \sum_{i=1}^{n}\left[E\left\{\left(X_{i j}-\mu_{j}^{X}\right)^{4}\right\}\right]^{1 / 2} / n \\
& +c_{2} \max _{1 \leq j \leq p} \sum_{i=1}^{m}\left[E\left\{\left(Y_{i j}-\mu_{j}^{Y}\right)^{4}\right\}\right]^{1 / 2} / m \\
\leq & {\left[\max _{1 \leq j \leq p} \sum_{i=1}^{n} E\left\{\left(X_{i j}-\mu_{j}^{X}\right)^{4}\right\} / n\right]^{1 / 2} } \\
& +c_{2}\left[\max _{1 \leq j \leq p} \sum_{i=1}^{m} E\left\{\left(Y_{i j}-\mu_{j}^{Y}\right)^{4}\right\} / m\right]^{1 / 2} \\
\leq & c_{3} B_{n, m}
\end{aligned}
$$

for some $u$ iversal co sta ts $c_{2}, c_{3}>0$, where the seco $d$ i equalit is $b$ co ditio (a), the third i equalit is based o Je se 's i equalit, the fourth i equalit holds from the Cauch Schwar i equalit a d the last i equalit follows from co ditio (c). To this e d, b combi i g (30), (31), (e) with (29), it ca be deduced that there exists a u iversal co sta $\mathrm{t} c_{4}>0$ such that

$$
\begin{equation*}
\max _{j \leq p}\left\{e_{j}^{\prime}\left(\hat{\Sigma}^{X}+n m^{-1} \hat{\Sigma}^{Y}\right) e_{j}\right\} \leq c_{4} B_{n, m} \tag{32}
\end{equation*}
$$

with probabilit te di g to o e. Together with (28), it ca be veri ed that

$$
\begin{equation*}
c_{B}(\alpha) \leq\left\{4 c_{4} B_{n, m} \log (p n)\right\}^{1 / 2} \tag{33}
\end{equation*}
$$

with probabilit te di g to o e Now, we set the co sta $\mathrm{t} K_{S} \mathrm{i}$ (f) as $K_{s}=4 c_{4}^{1 / 2}$, a d it the follows from (f) a d (33) that

$$
\begin{equation*}
\left\|n^{1 / 2}\left(\mu^{X}-\mu^{Y}\right)\right\|_{\infty}-c_{B}(\alpha) \geq\left\{4 c_{4} B_{n, m} \log (p n)\right\}^{1 / 2} \tag{34}
\end{equation*}
$$

with probabilit te di g to $\mathrm{o} \mathrm{e} . \mathrm{Hece}$, it ca be deduced that with probabilit te di g to o e,

$$
\begin{aligned}
& \operatorname{Power}^{*}\left(\mu^{X}-\mu^{Y}\right) \\
& \qquad \geq P_{e^{*}}\left[\left\|S_{n}^{e^{*} X}-n^{1 / 2} m^{-1 / 2} S_{m}^{e^{*} Y}\right\|_{\infty} \leq\left\{4 c_{4} B_{n, m} \log (p n)\right\}^{1 / 2}\right] \\
& \quad=1-P_{e^{*}}\left[\left\|S_{n}^{e^{*} X}-n^{1 / 2} m^{-1 / 2} S_{m}^{e^{*} Y}\right\|_{\infty} \geq\left\{4 c_{4} B_{n, m} \log (p n)\right\}^{1 / 2}\right] \\
& \quad \geq 1-2 p \exp \left(-4 c_{4} B_{n, m} \log (p n) /\left[2 \max _{j \leq p}\left\{e_{j}^{\prime}\left(\hat{\Sigma}^{X}+n m^{-1} \hat{\Sigma}^{Y}\right) e_{j}\right\}[)[ \}\right.\right.
\end{aligned}
$$
